PT	New	polypeptide usef	ul for treating and dia	state
PT	compri	rises an i	enic portion of prostat	protein -
PS	Clai	im 1; Page	135-136; 263pp; English.	
X S	The	present invention	vention describes isolated poly	peptides, comprising an
ខូខូ	immu and	nogenic po polynucleo	f a prostate tumour neoding them have ev	protein (PTP). The polypeptides tostatic activity and can be
ည (nseq	in vaccin	es and in gene therapy. The pol	ypeptides and
ខ្លួ	poly.	nucleotide polypeptid	s encoding them, antigen presenes, antibodies against the polym	ting cells which express peptides and vaccines
55	СОШР	rising the	m can be used for inhibiting the	
38	canc or a	er in a pa nti-idioty	tient. The polypeptides can be pic antibodies for passive immu	used to generate antibodies no therapy. A portion of
ខ្ល	the to	polynucleo odulate th	tides encoding the polypeptides e expression of the polypeptides	can be used as a probe or s. AAA06241 to AAA06691 and

prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), anticologies to (II), (Iusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic.
                                                                                                                                                               methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  343

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polynucleotides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704P, P712P, P775P and B335D are located in a genomic region on chromosome 22gil. 2 known as the Cat Eye Syndrome region. Prostate specific antigen (P5A) P501S was located on promore and polypeptide sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of

```
The present invention describes an isolated polypeptide (I) comprising at least an immunogenic portion of a prostate tumour antigen protein or lifs variant. (I) have extostatic activity and can be used in vaccine production. (I), prostate tumour antigen polynuclectides, an antigen presenting cell (APC e.g. a dendritic cell) that expresses (I), and a pharmaceutical composition containing (I) are useful for inhibiting the appearance in a patient. Antibodies specific for prostate specific proteins and oligonuclectides that hybridise to a polynuclectide that encodes a prostate specific protein are useful for detecting the presence or absence of a cancer or monitoring the progression the progression a cancer, especially prostate cancer. Antibodies to AAR20122 to AAR20123, AAB71821 and AAB74821 and AAB74830 are sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                      Prostate tumour antigen determined full length cDNA sequence for L1-12.

The sequences are useful for treating cancer, preferably breast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a

```
of
cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that bind to a breast tumour polypeptide, detecting in the sample an amount of polypeptide that binds to the binding agent, and comparing the amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient. Sequences ABK28920-ABK29025 represent cDNA clones encoding human breast tumour polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 343

The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (for antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for

```
The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (II). (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      340
                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide encoding a prostate-specific protein, for diagnosing, monitoring and treating prostate cancer in a patient and

The present sequence is that of a triple gene fusion comprising, from the 5' end, the trxA thioredoxin gene from Escherichia coli, the human ubiquitin coding sequence, the prostate antigen P501S (amino acids 55-53) coding sequence, the prostate antigen P501S tail. The triple fusion was constructed in plasmid pRIT15063, which included the Saccharomyces cerevisiae CUP1 promoter and yeast alpha prepro signal sequence. The triple fusion protein (see AAM50661) was produced in E. coli G7724 transformants. This is an example of the production of triple fusion proteins of the invention comprising ubiquitin (used between thioredoxin and a protein of interest, in this case P501S(aa55-553). A claimed method
                                                                                                                                                                                                                                                                                                                                        of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coli) under conditions which allow for co-expression of the triple fusion and a ubiquitin-specific endoprotease (especially UBPI from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the ubiquitin-specific endoprotease in vivo. In the present case, a p501-like protein of 509 amino acids is generated. The recombinant protein can used as a vaccine for cancer therapy.

invention relates to isolated prostate; specific

ynucleotides, polypeptides, fusion proteins of the polypeptides,
ibodies raised against the polypeptides (or antigenic epitopes
ilved from them) and antigen-presenting cells expressing the
ypeptides. The antibodies are useful for detecting the presence of
noer, especially prostate cancer. The polypeptides, polynucleotides and
sells specific for a tumour protein, and for inhibiting the development
cancer especially prostate cancer. Compositions comprising the
ynucleotide and/or polypeptide are useful for stimulating an immune
phonse, and for treating cancer. The oligonucleotide is useful for
ecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human prostate-specific polypeptides and polynucleotides useful for diagnosis and treatment of cancer, especially prostate cancer -

```
The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I). (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93337 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    453 ACTACATCCTCCTTCCTTTCCTGTTCCAGATACATGCCACCTGGCATGTGGGACAGGAGTA 512

ARDABO1220-AAD05282 represent CDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the protein stagements or variants. CC AAE01413. represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. The secreted proteins and their genes are useful for preventing, treating conditions can be diagnosed by determining the amount of the case of the issues in which they are most highly expressed, and include consection in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 21 genes, consect tumours for the diagnosis or treatment of proliferative developing products for the diagnosis or treatment of proliferative developing products for the diagnosis or treatment of proliferative concert, tumours, foetal and developmental abnormalities, disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, alergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitais, sepsis, diabetes, atherosclerosis, cardiovascular disorders, and indication organs condition controls of prequent of primary tissues, conditieration, to prevent skin aging due to subburn, to maintain organs contribers and and inchemotaxis, and can be used as a food additive or corresponding to modify storage properties. Antibodies specific for a preservative to modify storage properties. Antibodies specific for a Human; secreted protein; proliferative disorder; cancer; tumour; asthma; foctal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; Parkinson's disease; cognitive disorder; schizophrenia; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; inflammation; neurological disorder; Alzheimer's disease; food additive; angiogenic disorder; kidney disorder; paskrointestinal disorder; allergy; pregnancy-related disorder; endocrine disorder; infection; wound healing; cell culture; chemotaxis; vulnerary; binding partner identification; naturally occurring New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autoimmune disease and cancer, and used as a food additive or Baker KP; protein" /transl_except= (pos:209..211, aa:Xaa) /note= "Xaa corresponds to any of the protein" /product= "Mature human secreted Σ Fiscella /*tag= a /product= "Human secreted Claim 1; Page 388-389; 490pp; English. ```
cancer especially prostate cancer. Compositions comprising the ynucleotide and/or polypeptide are useful for stimulating an immune ponse, and for treating cancer. The oligonucleotide is useful for ecting cancer. The present sequence is a prostate specific ynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GCTGCCTCTTACCCTCCCTAGGTCTGCGCCTTTGAATAAGTATCACTTMTTAGTTGCTCC 1003

cancer, especially prostate cancer. The purypertures, project the antigen-presenting cells are useful for stimulating and/or expanding the antigen-presenting cells are useful for stimulating the development of cancer especially prostate cancer. Compositions comprising the polyprotide and/or polypreptide are useful for stimulating an immune response, and for treating cancer. The oligonocleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and the antibodies to (II), tusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) and (II) can be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. Analys337 to Analys344 and AaM01115 to exemplification of the present invention.

The present sequence is that of a triple gene fusion comprising, from the 5' end, the trxA thioredoxin gene from Escherichia coli, from the 5' end, the trxA thioredoxin gene from Escherichia coli, and the man ubiquitin coding sequence, the prostate antipen PSOIS (amino acids 1-320) coding sequence, and DNA encoding a histidine tail. The triple fusion was constructed in plasmid pRITIS115, under the control of the lambda pL promoter. Triple fusion protein (see AAMSOG62) was production of triple fusion proteins of the invention comprising ubiquitin fused between thioredoxin and a protein of interest, in this case PSOIS(aal-320). A claimed method of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coli) under conditions which allow conceptease (especially UBPI from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial
                                                                                                                                                                                                                                                                                                                                                              Novel DNA sequence encoding triple fusion protein comprising ubiquitin fused between thioredoxin and polypeptide of interest, useful for producing recombinant polypeptide of interest suitable for medicinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ubiquitin-specific endoprotease in vivo. In the present case, expression was controlled by addition of tryptophan. The recombinant protein can used as a vaccine for cancer therapy.

```
The invention relates to isolated nucleic acid (ABN81319-ABN81324),

corresponding to genes differentially expressed in mast cells following

activation or in patients with allergic hypersensitivity disease. (I)

that encodes proteins (AB877569-AB877575) [II] or a protein fragment of

that least 6 amino acids. (II) is useful for identifying binding

constant or (II) if at least 6 amino acids. (II) is useful for identifying binding

constant or atopic dermatitis or mastocytosis) in a subject which

constrain or atopic dermatitis or mastocytosis) in a subject which

constrain or atopic dermatitis or mastocytosis) in a subject which

constrain or atopic dermatitis or mastocytosis) in a subject which

constrain or atopic dermatitis or mastocytosis) in a subject which

constrain or atopic dermatitis or mastocytosis in a subject which

constrain or atopic dermatitis or mastocytosis in a subject which

constrain or atopic dermatitis or identify the relative expression level of

constraint or monoclonal antibodies. (II) is useful for identifying

agonists or antagonists or activity and as an antigen to raise

collating biological activity and function of (II) and thus are useful

constraint or monoclonal antibodies in a plergic hypersensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis.
                                                                                                                                                                                                                                                                                         Novel isolated nucleic acids that are differentially expressed in mast cells in patients with allergic hypersensitivity, encoding proteins associated with mast cell regranulation and allergic hypersensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3663 BP; 740 A; 1058 C; 985 G; 880 T; 0 other;

uncleotides, polypeptides, fusion proteins of the polypeptides, odies raised against the polypeptides (or antigenic epitopes ediform them) and antigen-presenting calls expressing the epitides. The antibodies are useful for detecting the presence of intigen-presenting calls are useful for detecting the presence of intigen-presenting calls are useful for stimulating and/or expanding. Is specific for a tumour protein, and for inhibiting the development uncleotide and/or polypeptide are useful for stimulating an immune note, and for treating cancer. The oligonucleotide is useful for intign cancer. The present sequence is a prostate specific for the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             uman prostate-specific polypeptides and polynucleotides useful for iagnosis and treatment of cancer, especially prostate cancer -

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I). (II), antibodies to (II), fusion proteins comprising (II), and isolated the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide encoding a prostate-specific protein, for diagnosing, monitoring and treating prostate cancer in a patient and

The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to produce antibodies which can be used in treatment. The present sequence is one of the PS108 partial coding sequences.
                                                                                                                                                                                                                                                                                                                338

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence tag (EST) consensus sequence. The sequence was produced from overlapping PSIOB ESTs sequences to produce a full length consensus sequence. This sequence was then used to produce PSIOB polypeptides which are useful in assays for detecting antibodies to prostate tissue, and as immunogens to produce antibodies. The polypeptide is useful for screening compounds which specifically bind to the polypeptide is useful for screening for drugs, compounds, or any other agent which can be used to treat diseases associated with PSIOB. The antibody is useful to detect, or for image localisation of, PSIOB antigen in a patient, for detecting or diagnosing a disease or condition, as delivery agents for therapeutic agents as well as for diagnostic tests and for screening for diseases or conditions associated with PSIOB, especially cancer. The antibody is also useful for generating chimeric antibodies for therapeutic uses for inhibiting the biological activity of PSIOB, in therapy (for e.g. to the prostate tissue disease including prostate cancer and its metastases), and to detect the presence of any polypeptide in a test sample which shares one or more antigenic determinants with the PSIOB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is derived from overlapping clones AAV71166-79. The clone sequence is derived from overlapping clones AAV71166-79. The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, ps108 polynucleotide. The products can be used for detecting, proposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (PBH), prostatic intrappithelial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 338

The sequence represents the coding sequence of prostate gene PS108-
specific expressed sequence tag (EST) CDNA clone 171346fH. The sequence
was used along with other overlapping CDNA clones to produce a full
length consensus sequence (see AASO7155). This sequence could then be
used to produce PS108 polypeptides which are useful in assays for
detecting antibodies to prostate tissue, and as immunogens to produce
antibodies. The polypeptide is useful for screening compounds which
specifically bind to the polypeptide and for screening for drugs,
compounds, or any other agent which can be used to treat diseases
compounds, or any other agent which can be used to treat diseases
compounds, or any other agent which can be used to treat diseases
compounds, or any other agent which can be used to treat diseases
compounds, or any other agent which can be used to treat diseases
compounds, or any other agent which for detecting or diagnosing a
disease or condition, as delivery agents for therapeutic agents as well
as for diagnostic tests and for screening for diseases or conditions
associated with PS108, especially cancer. The antibody is also useful for
generating chimeric antibodies for therapeutic use, for inhibiting the
tissue disease including prostate cancer and its metastases), and to
detect the presence of any polypeptide in a test sample which shares one

```
The present sequence represents the full length contig of the PS108 gene, as represented by clone 171346IM. This clone is the contig of overlapping clones AAV1166-79. The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108 specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (PPH), prostatitis, prostatic intraeplithelial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            321
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    182

The present sequence is derived from a prostate cancer-associated gene, and is represented by Incyte clone number 1864683. The sequence is used in the method of the invention. The specification clescribes a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comprises examining polymolecules, consisting of prostate cancer-specific genes, and genes of unknown function, expressed in CDNA libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the prostate cancer-specific genes. The biomolecules identified by the method form pharmaceutical compositions useful for the diagnosis and treatment of diseases associated with cell proliferation. Such diseases include cancer. The method may also be applied using other diseasers brostate cancer. The method may also be applied using other diseasers.

                                                                                                                                   g
                                                                                                                                                                            The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                  ValTyrLeuAlaSerValAlaAlaPheProValAlaAlaGlyAlaThrCysLeuSerHis 373

The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate.

The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polymucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polymucleotides encoding them, antigen presenting cells which express comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for inhibiting the development of prostate the polymucleotides encoding the polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polypeptides can be used as a probe or to modulate the expression of the polypeptides. AAA06541 to AAA06591 and AAAV82000 to AAAV8200 represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen presenting cells are useful for stimulating and/or expanding T cells specific for a tumnour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.

                    The sequence is a human prostate tumour cDNA which encodes a partial tumour protein. The DNA is useful for inhibiting the devol prostate cancer or for treating prostate cancer in a patient.
